2. Question

An Okta Implementation Consultant is testing the Okta RADIUS Server Agent deployment using a RADIUS testing tool. The Okta RADIUS Server Agent is already installed and configured with the customer's Okta org. Is this piece of information required for the Okta Implementation Consultant to be able to test the integration?

Option	Your Response	Correct Response	Feedback
RADIUS Server (IP address and port number)	Yes	Yes	This option is correct because setting up NTRadPing, a RADIUS testing tool for verifying if the configuration of Okta RADIUS Agent or designated RADIUS App is done correctly, requires entering the server IP Address where you have your Okta RADIUS Agent installed and the port you set up in your Okta RADIUS Application from the Admin Dashboard.
Okta Super Administrator credentials	Yes	No	This option is incorrect because Okta Super Administrator credentials are not required. The Okta Implementation Consultant needs the credentials from a user assigned to the Okta RADIUS applications but this user does not need to be an Okta Administrator.

3. Question

An Okta Implementation Consultant installed and configured four Active Directory Agents to provide high availability and failover protection.

Is this the behavior the Okta Implementation Consultant should expect if two of the Active Directory Agents fail?

Option	Your Response	Correct Response	Feedback
The Active Directory Agent that is next closest geographically will be selected first.	Yes	No	This option is incorrect because high availability and failover for the Active Directory Agents would not be based on geographic location of the agent.
The two failed Active Directory Agents will remain in the queue.	No	No	This option is incorrect because the failed Active Directory Agents would be marked unavailable.

4. Question

Is this statement true regarding Identity Provider (IdP) routing rules?

Option	Your Response	Correct Response	Feedback
You CANNOT create a rule for Okta as your provider.	No	No	This option is incorrect because you can create a rule for Okta as your provider.
IdP routing rules are helpful in an on-network vs. off-network scenario.	Yes	Yes	This option is correct because you can maintain alternate or legacy authentication for off-network users and use Okta for on-network users.
You can create a rule for each of your providers.	Yes	Yes	This option is correct because you can direct authentication based on the Okta user attributes or the application being accessed.

6. Question  
Is this a true statement regarding data migration?

Option	Your Response	Correct Response	Feedback
A hybrid live migration combines aspects of bulk import and Just-in-Time (JIT) migration.	Yes	Yes	This option is correct because a hybrid live migration is created by first bulk importing the identity attributes of the users and then setting their password during their first login (just-in-time).
Okta does NOT set the default profile source. The Okta Implementation Consultant needs to set it after the data migration.	No	No	This option is incorrect because the source of truth for attributes must be set at the stage of the migration process.

Question

During testing, an Okta Implementation Consultant noticed that when an inbound federation occurs and a user is logging in from the inbound IDP request, the user CANNOT be matched to the Okta Authentication response from the Okta org. Okta Org2Org integration is being used.

Is this an action the Okta Implementation Consultant should take to address this issue?

Option	User Response	Correct Response	Feedback
Configure Okta to deactivate users who are deactivated in Okta	No	No	This option is incorrect because user activation and deactivation are not related to the configuration options for when an inbound identity federation does not return an existing user.
Configure Okta to create a new user account with Just in Time (JIT) provisioning	Yes	Yes	This option is correct because if no match is found for the incoming identity of the user the two options that can be configured are to automatically create a new user just in time (JIT) or to redirect the user to the Okta Sign-in page of the destination Okta org.
Redirect the user to the Okta sign-in page	No	Yes	This option is correct because if no match is found for the incoming identity of the user the two options that can be configured are to automatically create a new user just in time (JIT) or to redirect the user to the Okta Sign-in page of the destination Okta org.

8. Question

The app manager at a company wants to improve the security concerning the company's apps, but does NOT understand why they should create authentication policies.

Is this what an Okta Implementation Consultant should tell the app manager to explain why implementing authentication policies will help the company achieve this goal?

Option	Your Response	Correct Response	Feedback
An authentication policy will enforce factor requirements on users when they sign in to an app.	Yes	Yes	This option is correct because authentication policies verify that users who try to sign in to the app meet specific conditions, and it enforces factor requirements based on these conditions.

13. Question  
Is this a true statement regarding on-premise provisioning (OPP)?

Option	Your Response	Correct Response	Feedback
Only a single connector can be created to provide connectivity to different on-premise applications.	No	No	This option is incorrect because you can create multiple connectors to provide connectivity to different on-premise applications, if necessary.
Communication between Okta and on-premise applications can only occur through the Okta Provisioning Agent and a native SCIM server.	Yes	No	This option is incorrect because Okta and on-premise applications communicate with each other through the Okta Provisioning Agent and a SCIM server. If an on-premise application does NOT support SCIM natively, a SCIM connector can be built using the Provisioning Connector SDK. A SCIM connector acts as a SCIM server and an intermediary between Okta and the on-premise application.
The provisioning connector receives SCIM messages from the Okta Provisioning Agent and integrates with the on-premise application using the API endpoints provided by that application.	Yes	Yes	This option is correct because a SCIM connector acts as a SCIM server and an intermediary between Okta and the on-premise application.

14. Question

A company has one Active Directory forest with two domains, Domain A and Domain B. Both domains have an Active Directory agent configured and are importing the Active Directory attribute "department" to the Okta field "department." The company configured Okta to ensure only one Okta account is created if users exist in both domains. Company policy requires users with accounts in Domain A and Domain B to use delegated authentication against Domain A, and wants the "department" value from Domain B to be reflected in Okta for all users.

Is this a configuration step that an Okta Implementation Consultant must take to achieve these goals?

Option	Your Response	Correct Response	Feedback
Place Domain B as priority #1 in Profile Sources	No	No	This option is incorrect because with this configuration users in multiple domains will be authenticated against Domain B.
Place Domain A as priority #1 in Profile Sources	Yes	Yes	This option is correct because it would ensure that users in multiple domains will be authenticated against Domain A.
Ensure the Okta attribute "department" is set to inherit from Okta	No	No	This option is incorrect because with this configuration, the value from Domain B will not be placed in the Okta attribute.

16. Question

An Okta Implementation Consultant is configuring Okta API Access Management to protect a customer's APIs. An OAuth 2.0 Client is configured in multiple access policies and multiple authorization servers.

Is this an expected behavior for this OAuth 2.0 Client?

Option	Your Response	Correct Response	Feedback
Multiple tokens will be generated, each with separate authorization policies, token expiration times, and scopes.	Yes	Yes	This option is correct because an OAuth 2.0 client can be assigned to any number of authorization servers. Doing so provides for a variety of tokens to be generated, each with separate authorization policies, token expiration times, and scopes.
The Resource Owner Password grant type will be used to determine which scopes are generated.	Yes	No	This option is incorrect because Okta recommends not using the resource owner password grant type in this scenario.

17. Question

Okta ThreatInsight is currently configured as "Log and enforce security based on threat level" with a network zone in the exempt zones.

Is this a step an Okta Implementation Consultant should take to unblock an IP blocked by Okta ThreatInsight?

Option	Your Response	Correct Response	Feedback
Search the IP in the System Log and add it to the exempted zone directly from the System Log	Yes	Yes	This option is correct because an IP can be added to an IP zone that is exempted by either going to the Network Zone section or directly from the System Log.
In the Okta Admin Panel, go to Network Zones and remove the IP from the BlockedIPZone	Yes	No	This option is incorrect because can be only added to an IP zone that is exempted by going to the Network Zone section or directly from the System Log.
Enable the "Log authentication attempts from malicious IPs" action	Yes	No	This option is incorrect because can be only added to an IP zone that is exempted by going to the Network Zone section or directly from the System Log.

19. Question

Is this a benefit of using an Okta-managed certificates when configuring an Okta custom URL domain?

Option	Your Response	Correct Response	Feedback
It is faster and easier to configure.	Yes	Yes	This option is correct because using an Okta-managed certificate when configuring an Okta custom URL domain is faster and easier than configuring a custom domain with your own TLS certificate.
Okta manages certificate renewals.	Yes	Yes	This option is correct because when using an Okta-managed certificate, Okta manages your certificate renewals in perpetuity.
It eliminates the risk of a site outage when the certificate expires.	No	Yes	This option is correct because when using an Okta-managed certificate, Okta manages your certificate renewals in perpetuity.

23. Question

A company's users are being locked out of their accounts. There has also been an increase in credential-based attacks (password spraying, brute-force, etc.) and the company wants to mitigate this.  
Is this a valid solution an Okta Implementation Consultant should recommend?

Option	Your Response	Correct Response	Feedback
Behavior Detection	Yes	No	This option is incorrect because with behavior detection and evaluation, Okta captures patterns of user behavior and uses this information to create profiles that describe typical patterns based on previous activity. After you configure the behavior conditions you're interested in, you can add them to your sign-on policy rules to control when users are required to provide multifactor authentication.
Multifactor Authentication	Yes	No	This option is incorrect because the purpose of multifactor authentication is to require users to verify their identity in two or more ways to gain access to their account.

23. Question

Is this statement about the Redirect Authentication Model true?

Option	Your Response	Correct Response	Feedback
When the Redirect Authentication Deployment Model is used, the user is kept in the application, which reduces redirects to and from Okta.	No	No	This option is incorrect because when the Redirect Authentication Model is used the user or system is redirected to Okta for credential verification and is then provided authorized access to the client application and other Service Providers.
The Redirect Authentication Deployment Model requires a greater level of effort to integrate and maintain compared to the Embedded Authentication Model.	No	No	This option is incorrect because the Embedded Authentication Model requires a higher level of effort to integrate and maintain compared to the Okta-hosted Sign-In Widget.
When the Redirect Authentication Deployment Model is used, cross-site scripting (XSS) attacks on the application can result in stolen sign-in credentials.	No	No	This option is incorrect because XSS (cross-site scripting) attacks on your application do not affect the sign-in experience when using the Redirect Authentication Deployment Model.
The Redirect Authentication Deployment Model is customizable through HTML, CSS, and JavaScript.	Yes	Yes	This option is correct because the Redirect Authentication Model is customizable through HTML, CSS, and JavaScript.

Sound Healthcare Technology Case Study

Sound Healthcare Technology

Company description

- Multinational healthcare technology company with three global offices
- 2,500 employees
- 300,000 customers

Existing technical setup of Sound Healthcare Technology

- The company has two Active Directory forests and five domains.
- Internally developed applications use OpenID Connect (OIDC)/OAuth 2.0.
- User accounts are available in multiple places such as a Microsoft SQL Server database, a CSV file, and Workday.
- Each partner has its own identity infrastructure and applications.
- The company's customers include companies with employees who work with applications that are hosted on-premises at Cloud Vault Financials. Some of those applications are custom-developed tools, scripts, and applications that run on Windows and Linux servers.
- Each internal business unit (for example, Sales, HR, Finance) maintains its own infrastructure and set of applications.
- Enterprise and cloud-based applications provide domain-specific access.
- Multifactor authentication (MFA) is NOT compatible with enterprise on-premise applications; users must authenticate to the corporate network via VPN.
- MFA is currently used for cloud-based applications.

Customer solution goals

- Add external user accounts into a centralized identity service; allow customers to self-register.
- Automate the creation of partner, contractor, and employee accounts.
- Adopt a more centralized approach to Identity and Access Management (IAM).
- Allow partners, customers, and contractors/employees to access applications for daily tasks more efficiently and effectively.
- Automate the process of provisioning users to applications seamlessly.
- Implement IT solutions that enhance user productivity and efficiency by ensuring end users can easily access applications.
- Deliver a return on investment (ROI) within one year and reduce the total cost of ownership (TCO) over the lifetime of the product.
- Develop an onboarding process via Workday as a source to minimize processing time for hire requests.

Refer to the supplemental information when answering this question.

View Sound Healthcare Technology Case Study

1. Sound Healthcare Technology wants to require Workforce users to authenticate using Okta and to use a custom Multifactor Authentication (MFA) solution as the second factor. After the Okta Implementation Consultant completed the configuration of the Identity Provider (IdP), routing rules, custom authenticator, and authentication policies, target users are NOT able to use the custom MFA solution as the second factor.

Is this a possible reason for the failure?

Sound Healthcare Technology Case Study

9. MFA is currently used for cloud-based applications.

Customer solution goals

1. Add external user accounts into a centralized identity service; allow customers to self-register.

2. Automate the creation of partner, contractor, and employee accounts.

3. Adopt a more centralized approach to Identity and Access Management (IAM).

4. Allow partners, customers, and contractors/employees to access applications for daily tasks more efficiently and effectively.

5. Automate the process of provisioning users to applications seamlessly.

6. Implement IT solutions that enhance user productivity and efficiency by ensuring end users can easily access applications.

7. Deliver a return on investment (ROI) within one year and reduce the total cost of ownership (TCO) over the lifetime of the product.

8. Develop an onboarding process via Workday as a source to minimize processing time for hire requests.

9. Enable Single Sign-On (SSO) for specified applications.

10. Implement a password-less authentication experience.

11. Ensure solution supports flexibility to add external use cases for future business-to-business (B2B) solutions so supply-chain partners can easily use applications.

12. Ensure that only employee-trusted devices gain access to company applications such as Microsoft Office 365.

Technical requirements for a new solution with Okta

1. Employees must be able to sign in to applications by using their Okta accounts.

2. When accessing corporate resources remotely, authentication must meet more stringent Authentication Assurance Levels (AALs).

3. Internal IT specifications and other documents should be shared between internal business units and partners by using Box or a similar application.

4. Sales data must be shared across internal business units and partners by using Salesforce.

5. Branding is very important; partners and customers must NOT see Okta domain.

6. Users must NOT see redirects to different domains during authentication for a seamless experience.

7. Adaptive MFA must be used to secure the partners' authentication to the company's apps.

8. Okta's core identity and access controls must be extended to the company's infrastructure and applications.

9. Extend Okta's identity solutions to Linux and Windows servers through Secure Shell (SSH) and Microsoft Remote Data Protocol (RDP).

10. Self-service options must be available to customers (registration, password operations, and so forth).

11. Workday must be implemented as a source of truth for employees.

26. Question  
Sound Healthcare Technology wants to require Workforce users to authenticate using Okta and to use a custom Multifactor Authentication (MFA) solution as the second factor. After the Okta Implementation Consultant completed the configuration of the Identity Provider (IDP), routing rules, custom authenticator, and authentication policies, target users are NOT able to use the custom MFA solution as the second factor.  
Is this a possible reason for the failure?

Claim	Your Response	Correct Response	Feedback
The IDP certificate is NOT managed by Okta	No	No	This option is incorrect because the certificate must only be valid; it does not need to be managed by Okta.
The custom authenticator is inactive	Yes	Yes	This option is correct because the custom authenticator must be enabled and appropriately configured to use a custom Multifactor Authentication (MFA) solution as the second factor.
The IDP is active	No	No	This option is incorrect the IDP should be active.
The IDP Usage setting is set for SSO only	Yes	Yes	This option is correct because to meet the requirements of this scenario, in the General Settings section on the Identity provider's page, the Okta Implementation Consultant must select the Factor only option from the IDP Usage dropdown; you can't use the SSO only option with the IDP authenticator.

37 Question

The Okta Implementation Consultant for Sound Healthcare Technology is configuring Multifactor Authentication (MFA) as a service for Active Directory Federation Services (ADFS). The Okta Implementation Consultant completed the following steps:

- Installed and configured Microsoft ADFS in Okta
- Installed the Okta ADFS Plugin on the ADFS server
- Enabled the Okta MFA Provider in ADFS

When the Okta Implementation Consultant attempts to log in to ADFS with a test user account, an error does NOT appear, but the Okta MFA prompt does NOT appear.

Is this a possible reason for this result?

Option	Your Response	Correct Response	Feedback
The Okta Implementation Consultant did NOT add the Access Control Policy to the relying party application.	No	Yes	This option is correct because adding the Access Control Policy to a Relying Party Application is a step that is required when configuring MFA for ADFS.

HIDE CORRECT ANSWER

HIDE FEEDBACK

Question 38

Sound Healthcare Technology wants to enforce Multifactor Authentication (MFA) for their employees who access network remotely using a VPN. For technical reasons, the organization has multiple VPN solutions deployed on their infrastructure. Sound Healthcare Technology is unsure if a single Okta RADIUS server agent supports multiple integrations. The company has engaged an Okta Implementation Consultant to set up MFA with the Okta RADIUS server agent to support the integration with multiple RADIUS-enabled applications at the same time.

Is this a consideration the Okta Implementation Consultant must keep in mind when configuring MFA?

Option	Your Response	Correct Response	Feedback
Multiple RADIUS apps must be added in Okta: one for each RADIUS-enabled application, configured with a different UDP port.	Yes	Yes	This option is correct because the Okta RADIUS server agent supports multiple ports simultaneously but one RADIUS app must be added in Okta for each RADIUS-enabled application being integrated with Okta.
A minimum of one Okta RADIUS server agent must be deployed for every RADIUS-enabled application.	Yes	No	This option is incorrect because one RADIUS app (not one Okta RADIUS server agent) must be added in Okta for each RADIUS-enabled application being integrated with Okta.

26. Question

An Okta implementation Consultant configured Okta FastPass for employees and contractors at Sound Healthcare Technology. During testing, the Okta implementation Consultant signs in to Salesforce on a macOS desktop set up for authentication with Okta FastPass. The Okta implementation Consultant then logs out and attempts to sign in to Salesforce from a private browser window (Incognito mode).

Is this the behavior the Okta implementation Consultant should expect?

Case	Your Response	Correct Response	Feedback
The user is automatically logged in.	No	Yes	This option is correct because on macOS or Windows desktops set up for authentication with Okta FastPass, if users access the Okta FastPass Dashboard from a private browser window (Incognito mode), they gain access to the page as if they were in a regular browser session. Okta Verify runs on the desktop, verifies the identity of the user, and grants them access to the dashboard. The authentication is not affected by the browser mode (regular or private).
The user is redirected to the Okta sign-in page.	Yes	No	This option is incorrect because on macOS or Windows desktops set up for authentication with Okta FastPass, the authentication is not affected by the browser mode (regular or private).

40. Question

An Okta implementation consultant completed an integration of single sign-on with Sound Healthcare Technology's Salesforce instance. When the Okta implementation consultant accessed the Tasso page in the Okta dashboard, the following error is displayed: "Automatic provisioning of user John Doe to app Salesforce.com failed: Matching user not found."

Is this a possible cause of this error message?

Claim	Your Response	Correct Response	Feedback
The third-party admin account reached a password expiration date.	No	No	This option is incorrect because it is associated with a different error: "Automatic provisioning of user John Doe to app Salesforce.com failed: The credentials used to connect to the API were invalid; please check your configuration."
The third-party admin password was changed out NOT updated in Okta.	No	No	This option is incorrect because it is associated with a different error: "Automatic provisioning of user John Doe to app Salesforce.com failed: The credentials used to connect to the API were invalid; please check your configuration."
The provisioning feature is enabled in Okta but the sync, update, and deactivate users options are NOT turned on.	Yes	Yes	This option is correct because the error message tells you that the Okta user option is not on, as the error message states that it was unable to find a user in the Salesforce application that matched this user, and therefore it could not assign the app flag option.

41. Question  
Sound Healthcare Technology configured agentless Desktop Single Sign-On (SSSO) and Just-in-Time (JIT) Provisioning.  
Is this the correct flow when a user that has NOT been imported into Okta tries to log in via agentless SSSO?  
Option Your Response Correct Response Feedback  
1. The web browser sends the SAML token to Okta. Yes No This option is incorrect because in Step 2, the Okta Active Directory Agent looks up the user's UPN.  
2. The Integrated Web Authentication (WAAgent) sends up the user's SAMLAccountName. No Yes This option is incorrect because if a user has not been imported into Okta and logs in via agentless SSSO with JIT enabled, Okta uses the UPN to validate the user. If the Okta username format isn't a UPN and it would use another format, Okta ignores the waiting and uses the UPN validation.  
3. If the user's SAMLAccountName is found, Okta validates the SAML token. No Yes This option is correct because if a user has not been imported into Okta and logs in via agentless SSSO with JIT enabled, Okta uses the UPN to validate the user. If the Okta username format isn't a UPN and it would use another format, Okta ignores the waiting and uses the UPN validation.  
4. Okta creates the user. No Yes This option is correct because if a user has not been imported into Okta and logs in via agentless SSSO with JIT enabled, Okta uses the UPN to validate the user. If the Okta username format isn't a UPN and it would use another format, Okta ignores the waiting and uses the UPN validation.  
5. The user signs in successfully. No Yes This option is correct because if a user has not been imported into Okta and logs in via agentless SSSO with JIT enabled, Okta uses the UPN to validate the user. If the Okta username format isn't a UPN and it would use another format, Okta ignores the waiting and uses the UPN validation.

Previous page

42. Question

The Okta Implementation Consultant for Sound Healthcare Technology configured Workday as a profile source for Okta. The Workday Administrator made updates to the emails of User A and User B, but only User A is reflecting the changes in Okta after repeated imports.

Is this a potential cause of the issue?

Option	Your Response	Correct Response	Feedback
User B is NOT linked to the corresponding profile in Workday.	No	Yes	This option is correct because if User B is not linked to the corresponding profile in Workday, this information will not be imported in to Okta when Workday is configured as the profile source.
Attribute-level sourcing is NOT configured correctly.	No	Yes	This option is correct because attribute-level sourcing allows you to designate different profile sources for different user attributes. If Attribute level sourcing is configured differently for Users A and B, User A could have been updated but not User B due to the different configurations.

43. Question

Sound Healthcare Technology configured Okta to bring in users from Workday HR, Active Directory, and a CSV file. All three identity stores are configured to be a profile source. In some cases, users will exist in two of the identity stores, and in some cases a user may exist in all three identity stores. The business requirements include using Workday data if it is available for a user, and the Workday data should be reflected in Okta.

Is this the correct priority setting that the Okta Implementation Consultant must set to achieve the requirements?

Option	Your Response	Correct Response	Feedback
Set Workday below CSV in profile sources	No	No	This option is incorrect because the CSV file data would take priority over Workday data if both are available.
Set Workday below Active Directory in profile sources	No	No	This option is incorrect because the Active Directory data would take priority over Workday data if both are available.
Set Workday as priority 1 in profile sources	Yes	Yes	This option is correct because setting Workday as priority 1 achieves the goal of using Workday data as the source, if it is available for a user.

46. Question

An Okta Implementation Consultant is configuring a native application for Sound Healthcare Technology that **CANNOT** store the secret.

Is this the OpenID Connect flow that the Okta Implementation Consultant should choose?

Option	Your Response	Correct Response	Feedback
Implicit flow	No	No	This option is incorrect because the implicit flow is a legacy flow used only for SPAs that cannot support PKCE.
Authorization code + PKCE flow	Yes	Yes	This option is correct because the Authorization Code flow with Proof Key for Code Exchange (PKCE) is the recommended flow for most applications whether server-side (web), native, or mobile.

1. The case study, credentials for your Okta orgs, and instructions are provided below. The timer in the upper left corner of the screen indicates the time remaining.

Note: After you have finished all of the use case tasks, click SAVE AND SUBMIT to submit your work for grading. Once you click SAVE AND SUBMIT, you will NOT be able to restart it. Please do not click the bottom of the screen as that action can also end the exam.

Part II InstructionsOrg InfoBackgroundUser Info

For Part II of this practice exam, you will be given access to three Okta orgs. The first Okta org will serve as an identity provider (Org2), and the third org will serve as a service provider. The tasks you will be asked to perform are provided as links in the other tabs on this page. The Okta org credentials are provided in the Org Info tab. The Background tab provides high level information about the scenario. The User Info tab provides information about the user assigned to the Consultant role. Specific details for each task are provided in the instructions.

You must complete Part II of this practice exam with the user assigned to the Consultant role. You are not allowed to use a browser to log in to the Okta orgs and perform the tasks for this exam.

If you are instructed to create and name something as specified in the instructions, the name should be as specified in the instructions.

47 Question

An Okta Implementation Consultant needs to provide a list of security best practices recommended for an Okta Access Gateway (OAG) deployment to Sound Healthcare Technology's security team.

Is this a security best practice to securely deploy OAG?

Option	Your Response	Correct Response	Feedback
Deploy Access Gateway admin node on the internal network	No	Yes	This option is correct because Okta recommends deploying the Access Gateway admin node on the internal network, separate from worker nodes so that the admin node is unreachable from the public Internet.

1. The case study, credentials for your Okta orgs, and four use cases are provided through the tabs below. The timer in the upper left corner of the test window displays the time you have remaining.  
**Note:** After you have finished all of the use cases and tasks on the exam and are ready to submit your work for grading, click SAVE AND SUBMIT EXAM. That action will end your exam and you will **NOT** be able to restart it. Please do **NOT** click Submit Unfinished Responses at the bottom of the screen as that action can also end your exam.

Part II Instructions | Org Info | Background | Use Case 1 | Use Case 2 | Use Case 3 | Use Case 4

For Part II of this practice exam, you will be given an Okta Admin account, which has unrestricted access to three Okta orgs. The first Okta org will serve as a service provider (Org1), the second Okta org will serve as an identity provider (Org2), and the third org will serve as an identity provider (Org3). The actual tasks you will be asked to perform are provided as Use Cases 1 through 4, which you can access through the other tabs on this page. The Okta org credentials you need for the exam are on the tab labeled "Org Info." The Background tab provides high level information for the project the Okta Implementation Consultant has been assigned. Specific details for configuration and testing are in the use cases.

You must complete Part II of this practice exam within 120 minutes, after which your access to the three Okta orgs will be revoked. You are not allowed to use a virtual machine to take this exam. Use a standard browser to log in to the Okta orgs and perform the tasks. Google Chrome is the recommended browser for this exam.

If you are instructed to create and name something like a group, policy, or rule, be sure to name it exactly as specified in the instructions. The name should be spelled correctly and have the same case as the instructions.

Part II Instructions | Org Info | Background | Use Case 1 | Use Case 2 | Use Case 3 | Use Case 4

The Security team at Cloud Vault Financials engaged the Okta Implementation Consultant to ensure that employees are seamlessly and securely accessing applications and resources necessary for their role.  
The Okta Implementation Consultant needs to:

- Configure a custom SAML 2.0 integration for users in the Customer Success department.
- Use the OIN to set up Okta Org2Org for users in the Operations department.
- Set up policies that enforce Multifactor Authentication.
- Configure a routing rule to ensure users in specified department are directed to the correct Identity Provider for login.

Part II Instructions | Org Info | Background | Use Case 1 | Use Case 2 | Use Case 3 | Use Case 4

1. Create an authentication policy that requires Password and Email if the user is a member of the Customer Success group. Ensure that users will not be prompted for a password while a password session already exists.

2. If you can, use a personal email address to receive the email verification code. Otherwise, if you are taking this exam on a device that is locked down, you may have to use a work email address. Edit Scott Delacruz's Okta Profile and set his primary email to the email address that you are using for this step.

3. Name the policy Custom App Policy and the rule Custom App Rule

4. Assign the policy to the AIW SAML - Customer Success application.

5. Log out of Org2 and log back in as scott.delacruz@oktacertified.com.

6. Click the tile for the AIW SAML - Customer Success application, and confirm that you are asked for an email. Respond to the MFA challenge accordingly and ensure that you are not prompted for an additional password. To access the email with your verification code, access the email that you are using for this use case.

What does this form do?

This form generates the XML needed for the app's SAML request.

Where do I find the info this form needs?

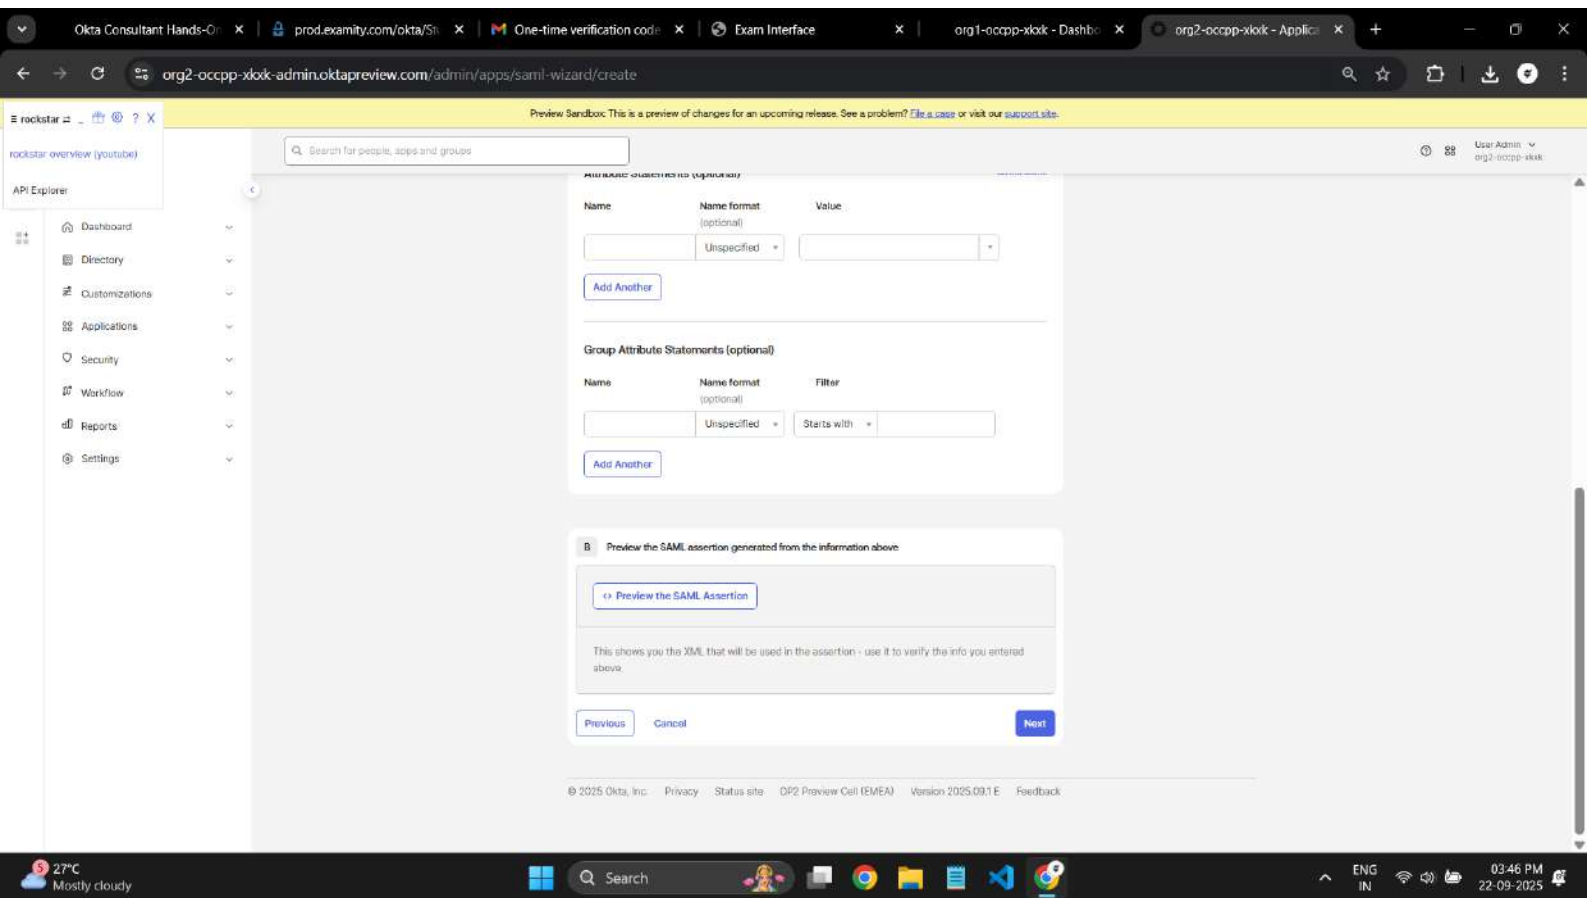

The app you're trying to integrate with should have its own documentation on using SAML. You'll need to find that doc, and it should outline what information you need to specify in this form.

About

SAML 2.0 streamlines the end user experience by not requiring the user to know their credentials. Users cannot edit their credentials when SAML 2.0 is configured for this application. Additional configuration in the 3rd party application may be required to complete the integration with Okta.

You can sync passwords to this app

If you enable provisioning and password push, you can automatically synchronize Okta passwords to Okta Org2Org.

Application Username

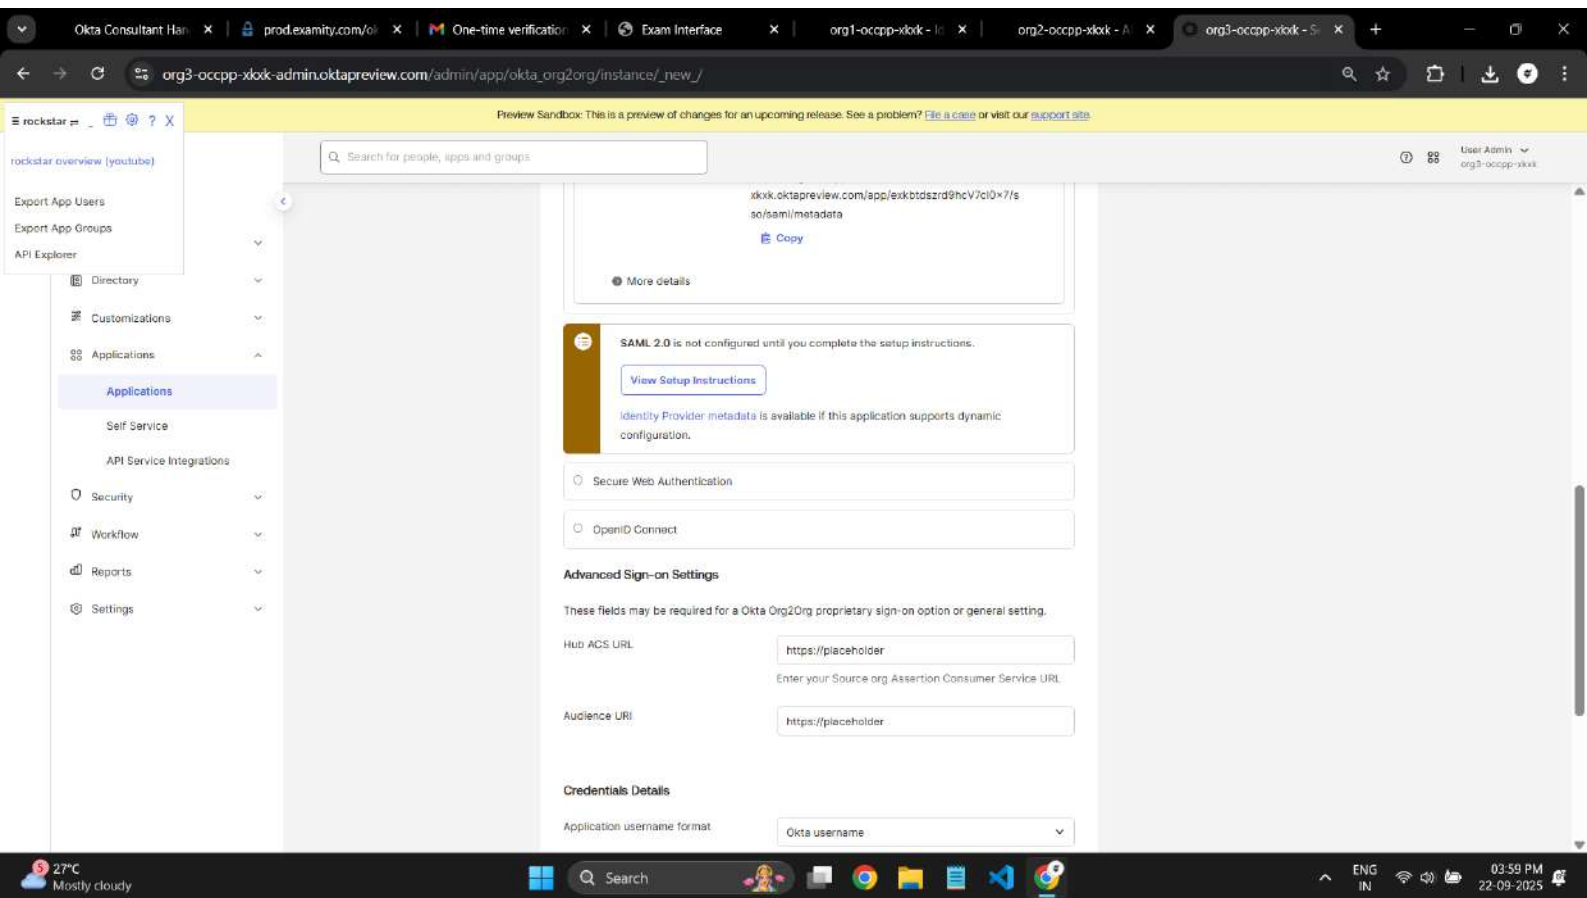

Choose a format to use as the default username value when assigning the application to users.  
  
If you select None you will be prompted to enter the username manually when assigning an application with password or profile

IdP Usage

SSO only

Claims

☐ Trust claims from this identity provider

Requires AMR claims in the third-party IdP response to prevent user lockouts. See [Configure claims sharing](#).

Account matching with Persistent Name ID

☒ Use Persistent Name ID (Higher Security)

Determine the associated user account by matching the Name ID with the External ID. If no match is found, account matching with IdP Username will be used. [Read more](#)

Account matching with IdP Username

IdP Username

idpuser:subjectNameId

☒ Expression Language Reference

Filter

☐ Only allow usernames that match defined RegEx Pattern

General settings

All fields are required to add this identity provider unless marked optional.

Authentication Settings

Expressions allow you to reference, transform, and combine attributes before you store them on a user profile or before passing them to an application for authentication or provisioning.

IdP Usage

Specifies how users from this IdP will be evaluated.

SSO only: Okta evaluates requests coming from the IdP as a password (knowledge factor).

Factor only: Okta evaluates requests coming from this IdP as a possession factor.
